## **Cheat Sheet: API's and Data Collection**

```
Package/Method Description
                                                                                                         Code Example
                              Syntax:
                                 1. attribute = element[(attribute)]
                Access the
                value of a
                              Copied!
                specific
Accessing
                attribute of an Example:
element attribute
                HTML
                element.
                                 1. 1
                                 1. href = link_element[(href)]
                               Copied!
                              Syntax:
                                 1. 1
                Parse the
                HTML content
                                1. soup = BeautifulSoup(html, (html.parser))
                of a web page
                               Copied!
                using
                BeautifulSoup.
BeautifulSoup()
                              Example:
                The parser
                type can vary
                based on the
                project.
                                 1. html = (https://api.example.com/data) soup = BeautifulSoup(html, (html.parser))
                              Copied!
                              Syntax:
                Send a
                DELETE
                request to
                                1. response = requests.delete(url)
                remove data or
                a resource
                              Copied!
                from the
delete()
                server.
                              Example:
                DELETE
                requests delete
                                1. 1
                a specified
                                 1. response = requests.delete((https://api.example.com/delete))
                resource on
                the server.
                              Copied!
                              Syntax:
                                 1. 1
                                 1. element = soup.find(tag, attrs)
                Find the first
                HTML
                              Copied!
                element that
find()
                matches the
                              Example:
                specified tag
                and attributes.
                                 1. 1
                                 1. first_link = soup.find((a), {(class): (link)})
                               Copied!
                              Syntax:
                                 1. 1
                                 1. elements = soup.find_all(tag, attrs)
                Find all
                HTML
                              Copied!
                elements that
find_all()
                match the
                              Example:
                specified tag
                and attributes.
                                 1. all_links = soup.find_all((a), {(class): (link)})
                               Copied!
                              Syntax:
                                 1. children = element.findChildren()
                Find all child
                               Copied!
                elements of an
findChildren()
                HTML
                              Example:
                element.
                                 1. 1
                                 1. child_elements = parent_div.findChildren()
                              Copied!
                Perform a
                              Syntax:
get()
                GET request
                                 1. 1
```

```
1. response = requests.get(url)
                to retrieve data
                from a
                 specified URL. Copied!
                GET requests
                               Example:
                are typically
                used for
                                 1. 1
                reading data
                 from an API.
                                 1. response = requests.get((https://api.example.com/data))
                The response
                               Copied!
                variable will
                contain the
                 server's
                response,
                which you can
                process
                further.
                Include
                               Syntax:
                custom
                                 1. 1
                headers in the
                request.
                                 1. headers = {(HeaderName): (Value)}
                Headers can
                               Copied!
                provide
Headers
                 additional
                information to Example:
                the server
                                 1. 1
                such as
                authentication
                                 1. base_url = (https://api.example.com/data) headers = {(Authorization): (Bearer YOUR_TOKEN)} response = r
                tokens or
                               Copied!
                content types.
                               Syntax:
                Import the
                necessary
                                 1. 1
Import Libraries
                Python
                                 1. from bs4 import BeautifulSoup
                libraries for
                 web scraping.
                              Copied!
                Parse JSON
                data from the
                response. This Syntax:
                extracts and
                                 1. 1
                 works with the
                data returned
                                 1. data = response.json()
                by the API.
                               Copied!
                The
                response.json() Example:
json()
                method
                converts the
                JSON
                                 2. 2
                response into a
                                 1. response = requests.get((https://api.example.com/data))
                Python data
                                 2. data = response.json()
                structure
                (usually a
                               Copied!
                dictionary or
                list).
                               Syntax:
                                 1. sibling = element.find_next_sibling()
                Find the next
                                Copied!
                 sibling
next_sibling()
                element in the Example:
                DOM.
                                 1. 1
                                 1. next_sibling = current_element.find_next_sibling()
                               Copied!
                               Syntax:
                                 1. 1
                                 1. parent = element.parent
                Access the
                parent element Copied!
                 in the
parent
                Document
                               Example:
                Object Model
                (DOM).
                                 1. parent_div = paragraph.parent
                               Copied!
                Send a POST Syntax:
post()
                request to a
                 specified URL
                with data.
                                 1. response = requests.post(url, data)
                Create or
                update POST Copied!
```

```
requests using Example:
                   resources on
                   the server. The
                   data parameter
                                     1. response = requests.post((https://api.example.com/submit), data={(key): (value)})
                  contains the
                   data to send to Copied!
                   the server,
                   often in JSON
                   format.
                   Send a PUT
                   request to
                                   Syntax:
                   update data on
                   the server.
                   PUT requests
                                     1. response = requests.put(url, data)
                   are used to
                   update an
                                   Copied!
                   existing
put()
                   resource on
                                   Example:
                   the server with
                   the data
                                     1. 1
                   provided in the
                                     1. response = requests.put((https://api.example.com/update), data={(key): (value)})
                   data
                   parameter,
                                   Copied!
                   typically in
                   JSON format.
                                   Syntax:
                                     1. 1
                   Pass query
                                     1. params = {(param_name): (value)}
                   parameters in
                   the URL to
                                   Copied!
                   filter or
                   customize the Example:
Query parameters request. Query
                   parameters
                                     2. 2 3. 3
                   specify
                   conditions or
                   limits for the
                                     1. base_url = "https://api.example.com/data"
2. params = {"page": 1, "per_page": 10}
3. response = requests.get(base_url, params=params)
                   requested data.
                                    Copied!
                                   Syntax:
                                     1. 1
                                     1. element = soup.select(selector)
                   Select HTML
                  elements from Copied!
select()
                   the parsed
                   HTML using a Example:
                   CSS selector.
                                     1. titles = soup.select((h1))
                                   Copied!
                   Check the
                                   Syntax:
                   HTTP status
                   code of the
                   response. The
                                     1. response.status_code
                   HTTP status
                   code indicates
                                   Copied!
                   the result of
                   the request
                                   Example:
status_code
                   (success, error,
                   redirection).
                                     2. 2
3. 3
                   Use the HTTP
                   status codeIt
                   can be used for
                                     1. url = "https://api.example.com/data"
                   error handling
                                      2. response = requests.get(url)
                   and decision-
                                     3. status_code = response.status_code
                   making in
                                   Copied!
                   your code.
tags for find()
                   Specify any
                                   Tag Example:
                   valid HTML
and find all()
                                     1.
                   tag as the tag
                                     2. 2
3. 3
4. 4
5. 5
                   parameter to
                   search for
                   elements of
                                     6.
                   that type. Here
                   are some
                   common
                   HTML tags
                                    10. 10
